Session 4A16
Room 15

Coupling of mechanical motion with frequency comb and Brillouin lasing in whispering gallery modes

Takasumi Tanabe, Ryo Suzuki, and Yoshihiro Honda

Department of Electronics and Electrical Engineering,
Faculty of Science and Technology, Keio University, Japan

Keio Univ

Outline

1. Brillouin laser in coupled WGMs

Y. Honda, W. Yoshiki, T. Tetsumoto, S. Fujii, K. Furusawa, N. Sekine, and T. Tanabe, “Brillouin lasing in coupled silica toroid microcavities,” *Appl. Phys. Lett.*, Vol. 112, 201105 (5 pages) (2018). (**Featured Article**) (**Scilight**)

2. Optomechanics with micro-combs

R. Suzuki, T. Kato, T. Kobatake, and T. Tanabe, “Suppression of optomechanical parametric oscillation in a toroid microcavity assisted by a Kerr comb,” *Opt. Express*, Vol. 25, No. 23, pp. 28806-28816 (2017).

High-Q whispering-gallery mode microcavities

Silicon nitride

Weiner group (Purdue)

Diamond

Loncar group (Harvard)

Crystalline (CaF₂, MgF₂, etc)

Kippenberg group (EPFL, Swiss),
Makei group (OE Waves)

Silicon

Gaeta group (Columbia)

AlN

Tang group (Yale)

Silica

Vahala group (Caltech)

AlGaAs

Yvind group (DTU, Denmark)

◆ Q-factor

$$Q = \omega \times \frac{\text{stored energy}}{\text{power in/out}}$$

◆ Photon density

$$\propto \frac{Q}{V}$$

Outline

2. Optomechanics with micro-combs

R. Suzuki, T. Kato, T. Kobatake, and T. Tanabe, “Suppression of optomechanical parametric oscillation in a toroid microcavity assisted by a Kerr comb,” Opt. Express, Vol. 25, No. 23, pp. 28806-28816 (2017).

Stimulated Brillouin Scattering (SBS)

□ Schematic representation of SBS process

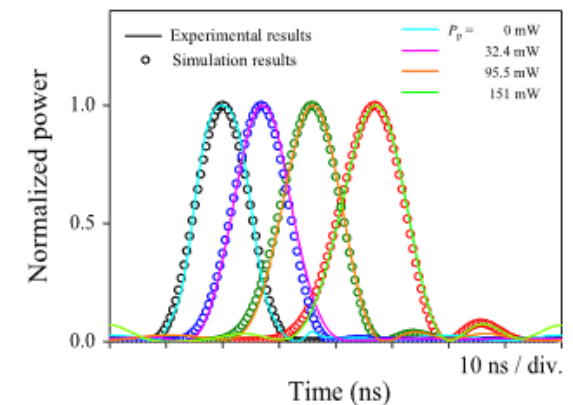

□ SBS applications

- Light storage
- Slow light generation
- High coherence lasers
- Microwave synthesizers

Z. Zhu, D. J. Gauthier, R. W. Boyd, Science **318**, 1748-1750 (2007)

T. Sakamoto, T. Yamamoto, K. Shiraki, and T. Kurashima, Opt. Express **16**, 8026–8032(2008)

Stimulated Brillouin Scattering (SBS)

Microcavities

Crystalline (CaF₂)

$$Q > 10^{10}$$

$$V \approx 10000 \text{ } \mu\text{m}^3$$

I. Grudin, *et al.*, Phys. Rev. A **74**, (2006).

Si₃N₄ microring

$$Q \approx 10^6$$

$$V \approx 1000 \text{ } \mu\text{m}^3$$

F. Foudous, *et al.*, Nat. Photon. **5**, (2011).

Silica toroid

$$Q \approx 10^8$$

$$V \approx 1000 \text{ } \mu\text{m}^3$$

T. J. Kippenberg, *et al.*, APL **85**, (2004).

Properties

- High Q
- Small mode volume V_m
- Small device size

$$(P_{SBS})_{th} \propto \frac{V_m}{Q^2}$$

Brillouin lasing

- Low threshold power
- Small device size

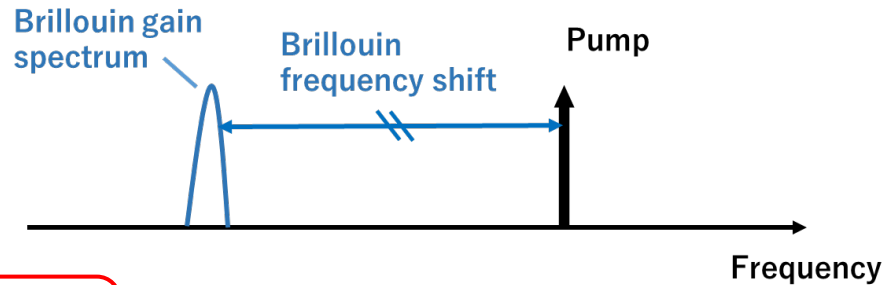

Applications

- Microwave synthesizers
- High coherence lasers

SBS in microcavities

Objective

Our work

SBS in coupled microcavities

- ~~Precise size control~~
- Low threshold
- Small footprint

Supermode splitting

Calculation

- Mode overlap
 - Phase matching condition
- } Coupling coefficient

$$\tilde{\kappa}_{C1,C2} = \frac{\omega \epsilon_0}{4} (n^2 - n_0^2) \times N_{C1} N_{C2} \iiint_{V_C} (E_{C1}(x, y, z) \cdot E_{C2}(x, y, z)) e^{i\Delta\beta z} dx dy dz$$

M. J. Humphrey, E. Dale et al., Opt. Commun. 271 124-131 (2007).

Supermode splitting is **larger** when the diameter of a microcavity is **smaller**

Experimental results

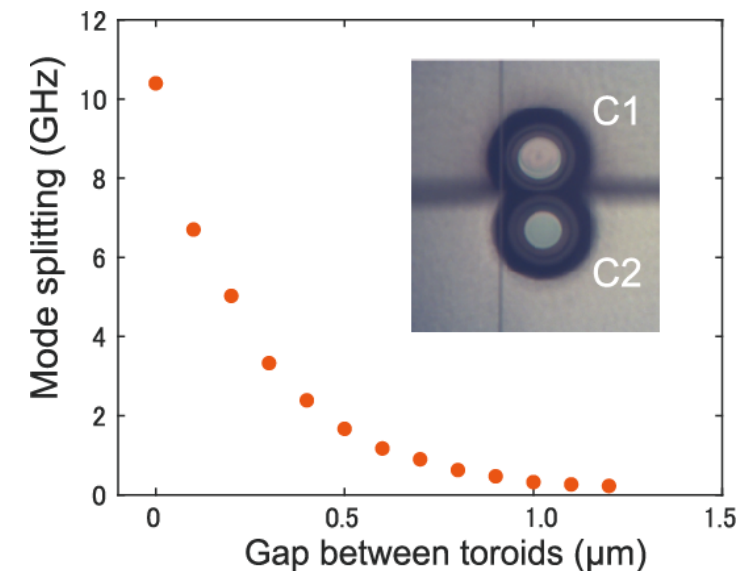

Fabricated 55- μm -diameter silica toroid

Moved toroids close together

Achieved more than 10GHz mode splitting

SBS in coupled cavities

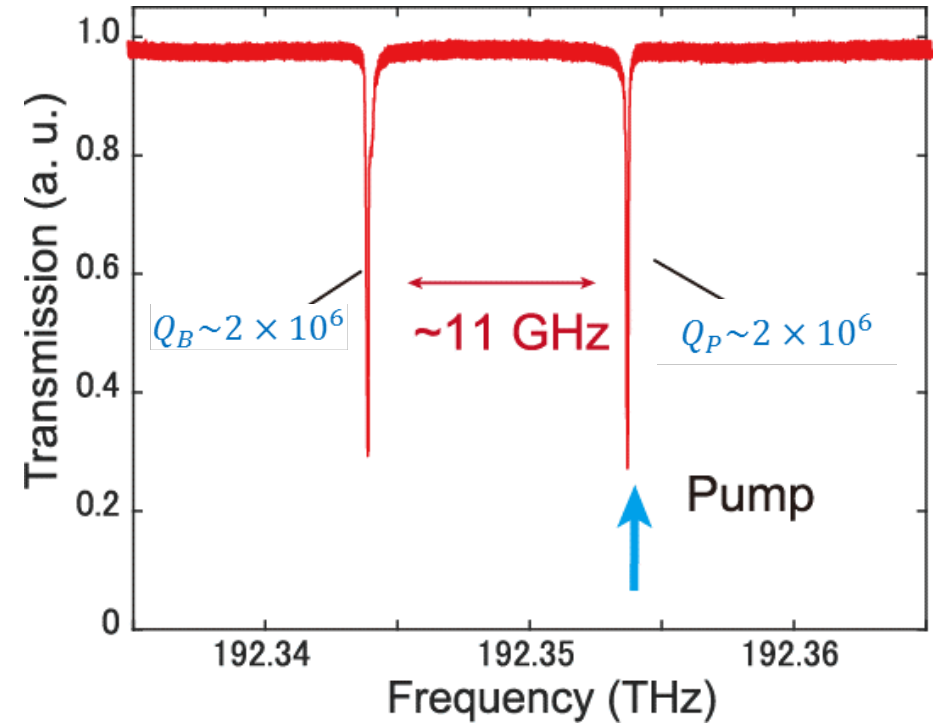

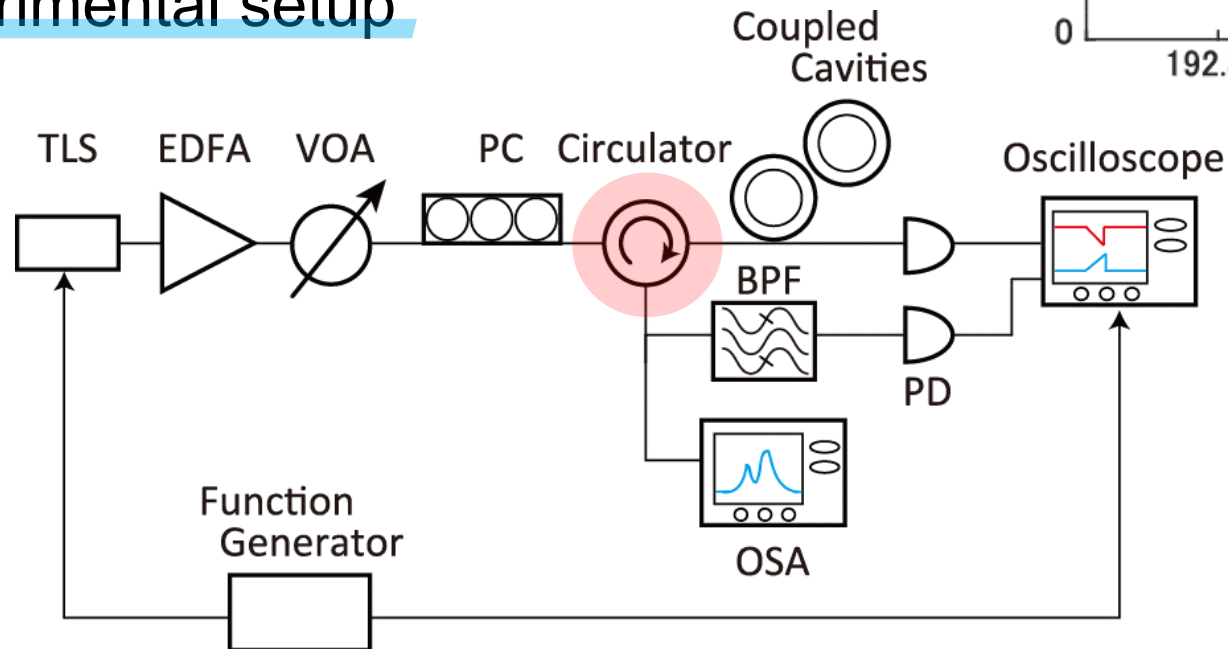

We achieved ...

Brillouin frequency shift in silica (11GHz)

=

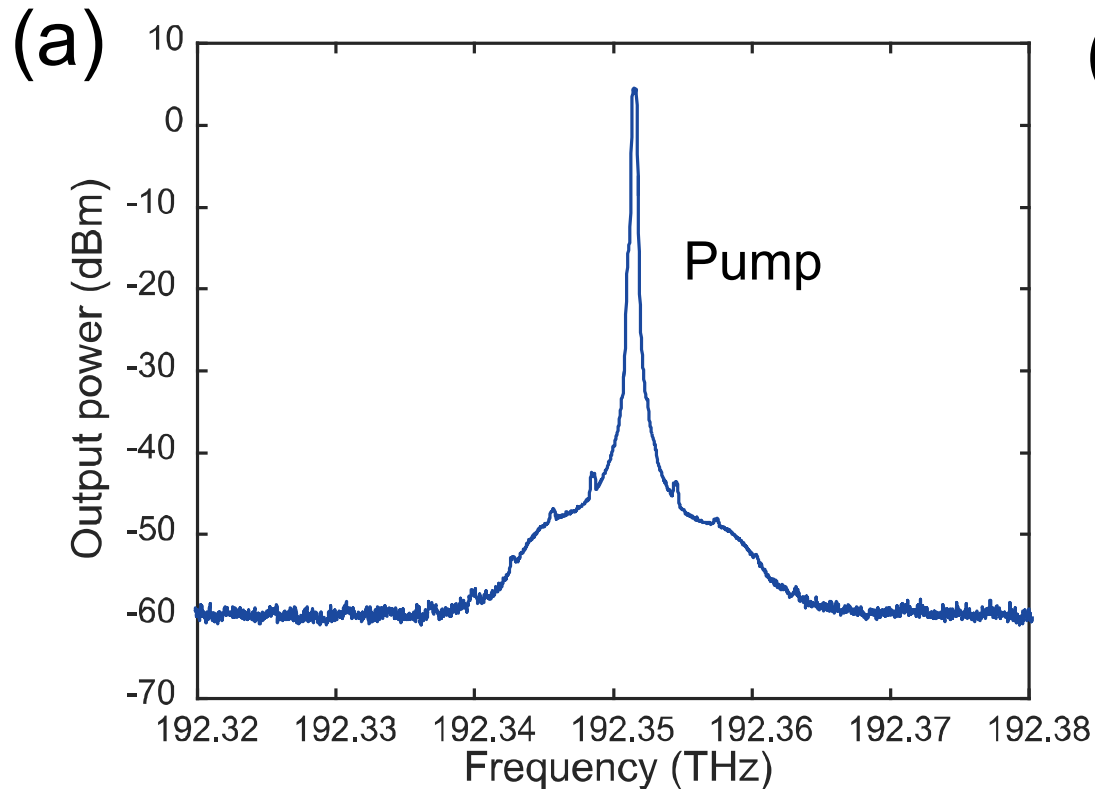

Mode splitting of supermodes

Experimental setup

SBS in coupled cavities

- We experimentally demonstrated SBS in coupled microcavities for the first time.
- We achieved a threshold power of about 50 mW (10 mW latest).

SBS in coupled cavities

- We experimentally demonstrated SBS in coupled microcavities for the first time.
- We achieved a threshold power of about 50 mW (10 mW latest).

Comparison with other Brillouin lasing

Summary (Brillouin laser)

- We achieved **the 11 GHz mode splitting** of supermodes that matches the Brillouin frequency shift in silica in coupled silica toroid microcavities.
- We experimentally **demonstrated SBS in coupled microcavities** and achieved a threshold power of 10 mW.

Outline

1. Brillouin laser in coupled WGMs

Y. Honda, W. Yoshiki, T. Tetsumoto, S. Fujii, K. Furusawa, N. Sekine, and T. Tanabe, “Brillouin lasing in coupled silica toroid microcavities,” Appl. Phys. Lett., Vol. 112, 201105 (5 pages) (2018). (**Featured Article**) (**Scilight**)

2. Optomechanics with micro-combs

R. Suzuki, T. Kato, T. Kobatake, and T. Tanabe, “Suppression of optomechanical parametric oscillation in a toroid microcavity assisted by a Kerr comb,” Opt. Express, Vol. 25, No. 23, pp. 28806-28816 (2017).

Microresonator frequency comb generation

▶ Microcavity frequency comb generation

▶ Silica toroid microcavity

▶ Microcomb in toroid

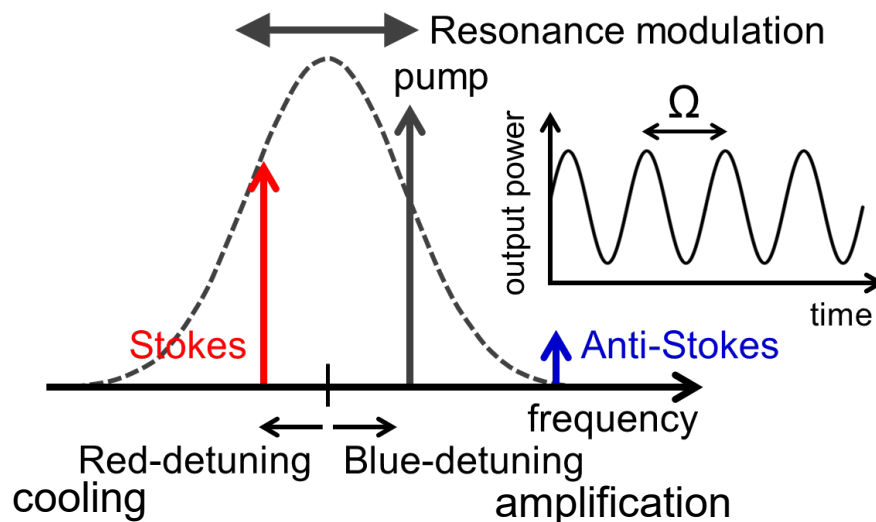

Cavity optomechanics

► Modulation by mechanical mode

Can observe optomechanical oscillation by measuring RF signal

► Amplification and cooling by different pump detuning

Blue- detuning \Rightarrow amplification
 Red detuning \Rightarrow cooling

Motivation

Optomechanical parametric oscillation (OMPO)

Blue-detuned pump : Amplification ($\Gamma_{\text{eff}} < 0$)

Red-detuned pump : Damping ($\Gamma_{\text{eff}} > \Gamma_m$)

$$\Gamma_{\text{eff}} = \Gamma_m + \Gamma_{\text{opt}}$$

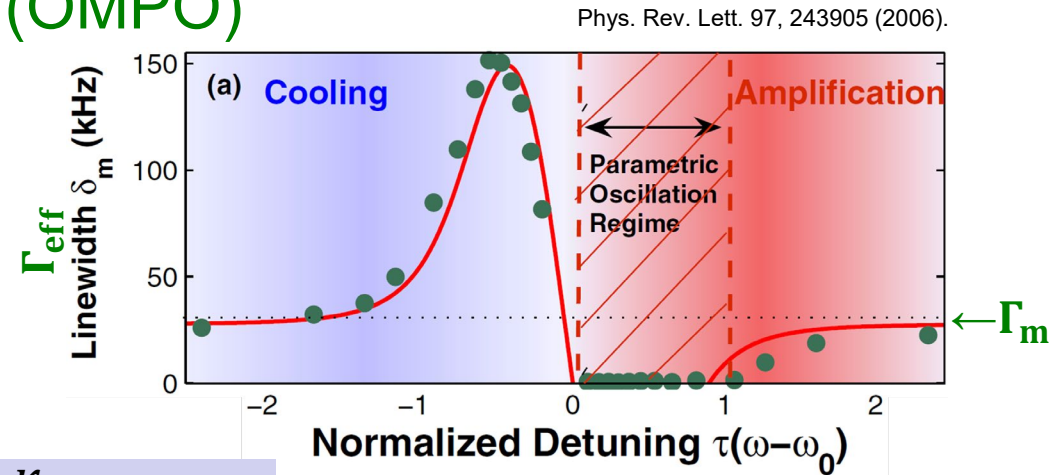

Γ_{eff} : effective mechanical damping rate

Γ_m : mechanical damping rate

Γ_{opt} : optomechanical damping rate

$$\Gamma_{\text{opt}} = |a_0|^2 g_{\text{om}} \left\{ \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_0 + \Omega_m)^2} - \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_0 - \Omega_m)^2} \right\}$$

$|a_0|^2$: number of intracavity photon
 $\Delta\omega_0$: laser detuning from resonance

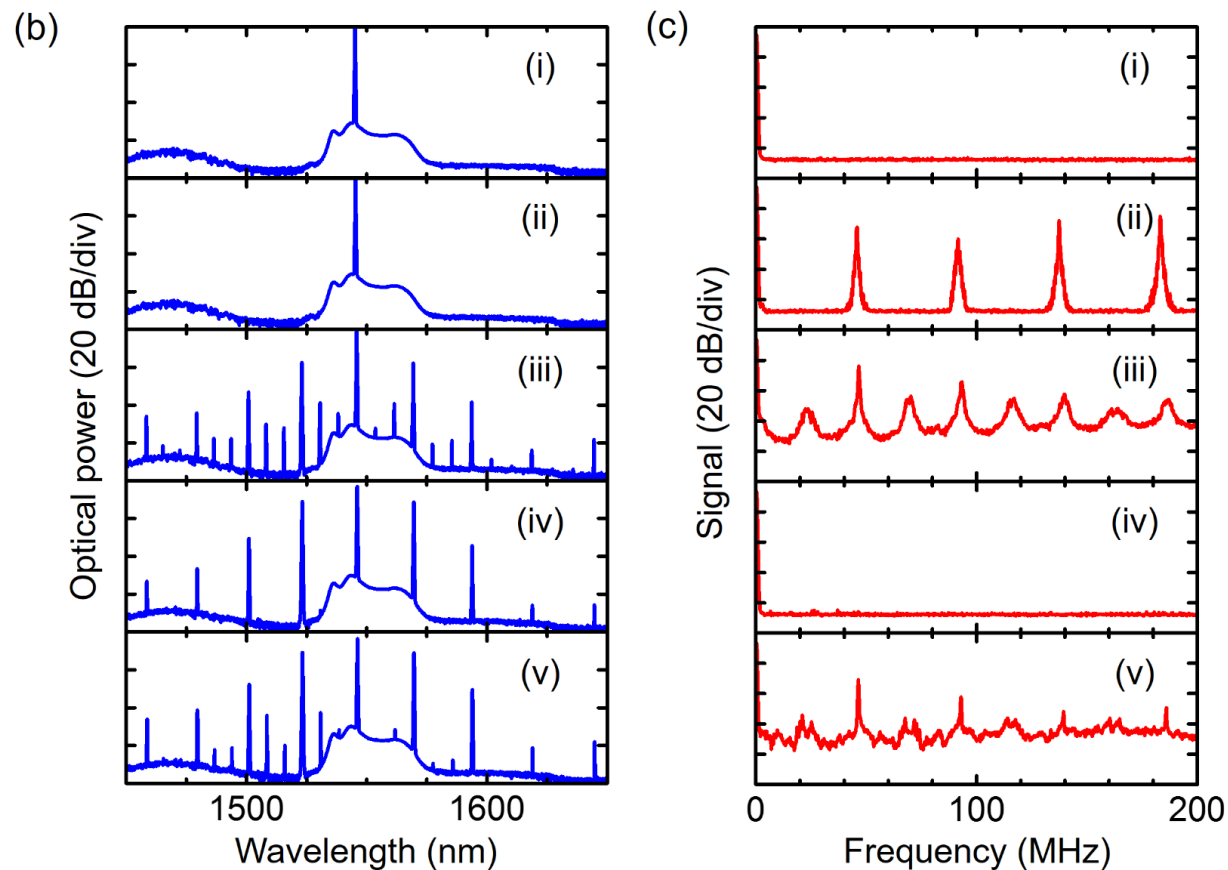

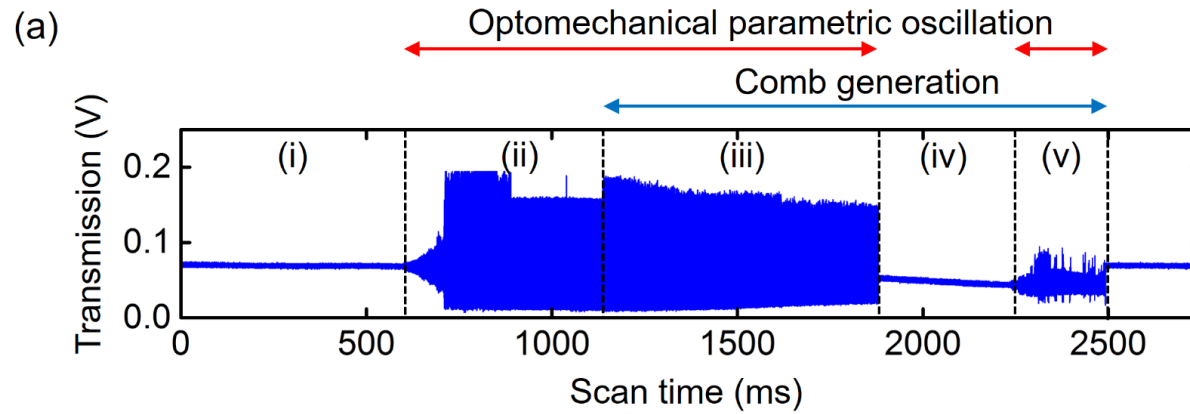

What will happen when frequency comb is generated in an opto-mechanically coupled resonator?

- Turing pattern microcomb in a silica toroid microresonator
 - Blue-detuned pump \Rightarrow amplification of oscillations
 - Red-detuned comb \Rightarrow damping of oscillations

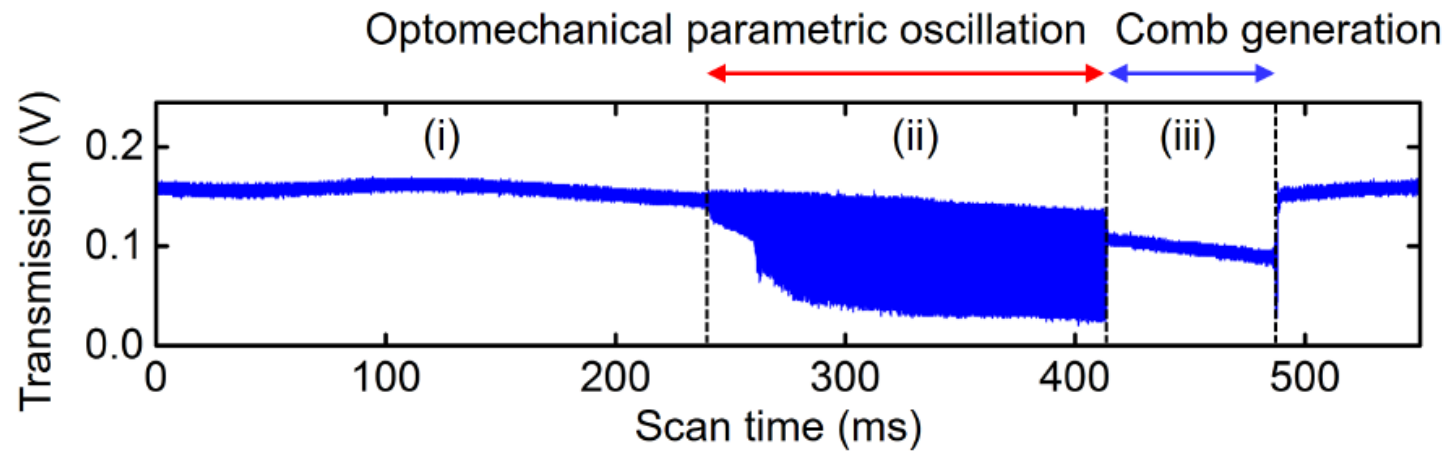

Microcomb and RF signals while scanning pump

Microcomb and RF signals while scanning pump

Cooling by the generated comb lines

Single-optomechanical
coupling with a resonance

$$\Gamma_{\text{eff}} = \Gamma_m + \Gamma_{\text{opt}}$$

Multi-optomechanical
couplings with resonances

$$\Gamma_{\text{eff}} = \Gamma_m + \sum_{\mu} \Gamma_{\text{opt},\mu}$$

Comb detuning measurement

To calculate optomechanical damping rates in each resonance mode, the comb detuning $\Delta\omega_\mu$ and the number of intracavity photon $|a_\mu|^2$ are needed.

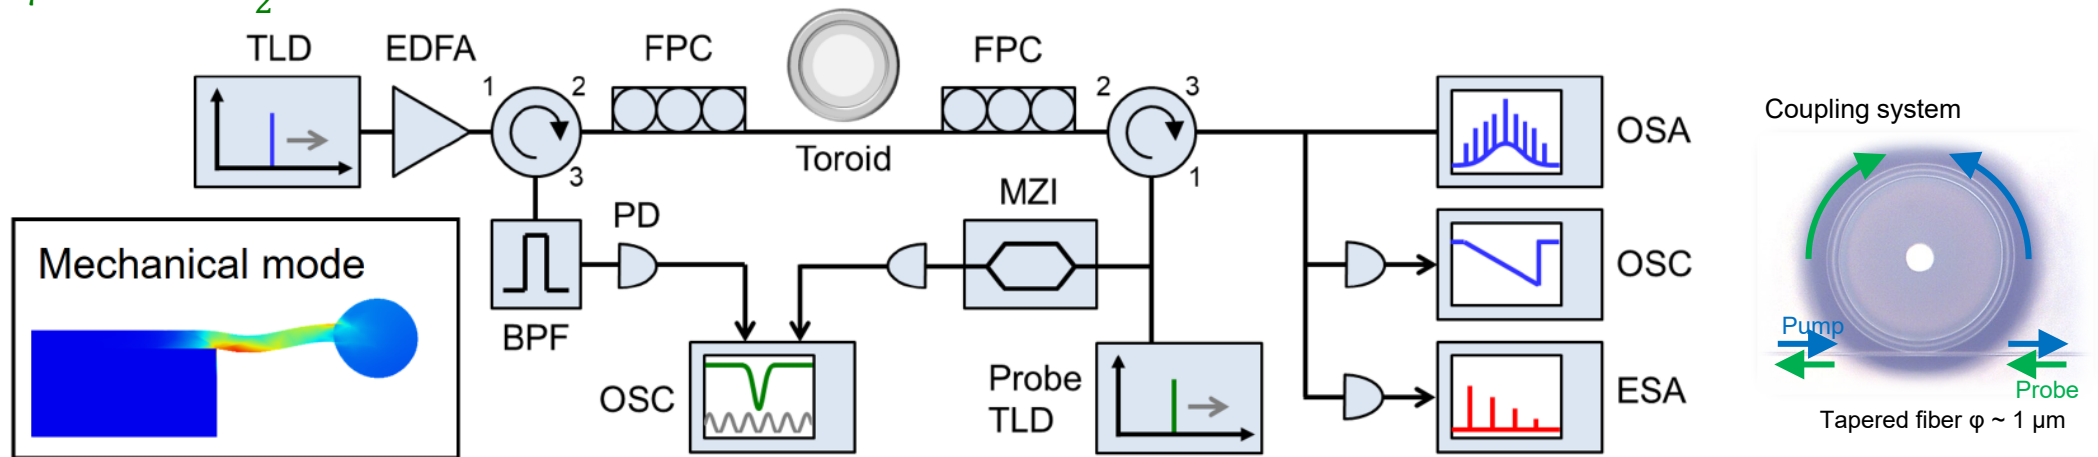

$$\Gamma_{\text{eff}} = \Gamma_m + \sum_\mu \Gamma_{\text{opt},\mu}$$

$$\Gamma_{\text{opt},\mu} = |a_\mu|^2 g_{\text{om}} \left\{ \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_\mu + \Omega_m)^2} - \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_\mu - \Omega_m)^2} \right\}$$

Comb detuning measurement

$$\Delta\omega_\mu \approx \Delta\omega_0 - \frac{1}{2} D_2 \mu^2$$

$$\Delta\omega_\mu = \omega_{\text{comb}} - \omega_\mu$$

Pump detuning regime for OMPO

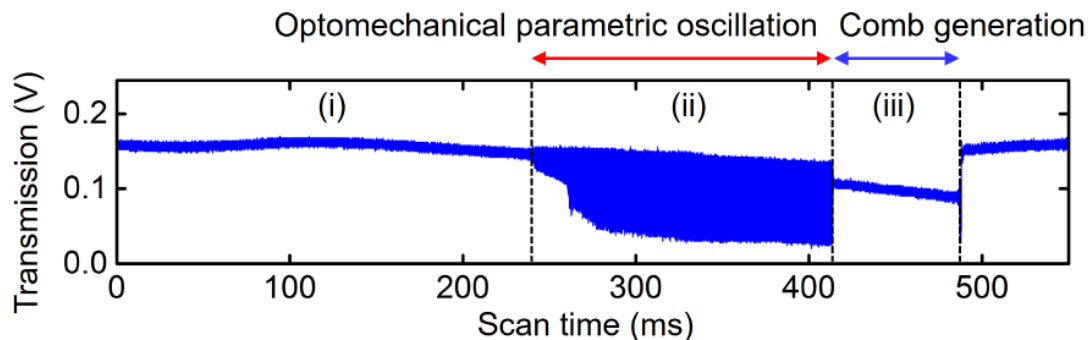

- Number of intracavity photon $|a_\mu|^2$ is obtained by measurement or LLE simulation
- Comb detuning $\Delta\omega_\mu$ follows the cavity dispersion D_2

$$\Gamma_{\text{eff}} = \Gamma_m + \sum_\mu \Gamma_{\text{opt},\mu} \quad \Gamma_{\text{opt},\mu} = |a_\mu|^2 g_{\text{om}} \left\{ \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_\mu + \Omega_m)^2} - \frac{\kappa}{\frac{1}{4}\kappa^2 + (\Delta\omega_\mu - \Omega_m)^2} \right\}$$

Pump detuning regime for OMPO

Transmission while scanning pump wavelength

Pump detuning regime that suppresses OMPO can be estimated from the cavity dispersion value and LLE simulation result

Summary

If only blue detuned pump light is present, optomechanical oscillations are always amplified. OMPO is suppressed when Turing pattern comb is generated, because all the lines appears in the red-detuning regime.

Single-optomechanical coupling with a resonance

$$\Gamma_{\text{eff}} = \Gamma_m + \Gamma_{\text{opt}}$$

Multi-optomechanical couplings with resonances

$$\Gamma_{\text{eff}} = \Gamma_m + \sum_{\mu} \Gamma_{\text{opt},\mu}$$

Summary

1. Brillouin laser in coupled WGMs

Achieved Brillouin lasing w/ 10 mW pump
Has potential to reduce down to 500 μ W.

2. Optomechanics with micro-combs

Cooling is possible even w/ blue detuned pump when comb is present
Anomalous dispersion allows the cooling the cavity
